

HISTORY

Since the year 2004, a composite materials engineer fascinated by ski touring, had the idea to develop a removable tibia support allowing to ski with walking shoes.

After 3 years of development and a dozen of prototypes, the principle of a pre-tensioned carbon fiber spring is born and quickly attract great mountain professionals (teachers of the Mountain Guiding school of Chamonix, mountain guides , elite units of mountain infantry).

As the tests were decisive including in the most extreme conditions (Cho-Oyu in the Himalayas, McKinley in Alaska, attempt to break a record in Antarctica ...!) the decision to launch the mass production is taken in 2007 simultaneously with the creation of the Company AlpControl.

PRODUCTS

The "Carbon / Titanium" v2009 is made of 2 carbon fiber springs and 12 titanium parts not to exceed 375 grams per foot. It's compatible with most mountaineering boots usually used below 5000 meters.

The "Custom" version is a model modified to fit to bulky expedition boots used between 5000 and 8000 m meters.

DEVELOPPEMENT

AlpControl is distributed in France and is looking for distributors in Europe and for an importer in North America.

AlpControl is also looking for a partner footwear manufacturer to develop a mountaineering boot dedicated to AlpControl and compatible with LowTec bindings.

AlpControl has been chosen to be finalist of the competition ISPO Brand New Awards and will be exhibitor in the **Brand New Village – Hall B3**
