

Description :

Glider equipped with a steering system and a brake which allows its user, either novice or experienced, to manoeuvre in any type of snow.

Innovations:

The "revolutionary" ski sole guarantees effective support and contact on ice, as well as deep snow. The foot brake assures the rider a progressive deceleration and an effective braking/stop. Geometrically perfected articulations assure the stability and the precision of the trajectory.

Technical Solutions, quality, function :

Judiciously using 100% recyclable material in our designer body structure, we have combined lines, surfaces, and forms, to create: contact lines which assist in maneuvering; smooth and emergent support surfaces; and a resistant and articulated structural volume.

Easy and fun to use :

The simple adherence of the boots to the board gives the rider the freedom and ability to guide. Pressing on the handlebar guarantees a control of the riders' heading, as well as frontal stability. The availability and effectiveness of the braking system allows for more relaxation and safety.

Press reviews :

The perfect symbioses achieved : stability and maneuverability, agility and speed control, freedom and safety – such is the prodigious challenge of the "biboard" which will unleash the tempest of the young and enchant the old. A sporty and playful glider, easy to use, a must try!
